# CH 67.5 – BEYOND SQUARE ROOTS

---

---

## □ ALL KINDS OF ROOTS

The number 9 has two **square roots**, 3 and  $-3$ . This is because  $3^2 = 9$  and  $(-3)^2 = 9$ . The positive square root of 9 (the 3) is denoted  $\sqrt{9}$ , and the negative square root of 9 (the  $-3$ ) is written  $-\sqrt{9}$ . In other words,  $\sqrt{9} = 3$ , and only 3, while  $-\sqrt{9} = -3$ .

In analyzing  $\sqrt{-25}$ , the “positive” square root of  $-25$ , we discover that we cannot find an answer for this problem, since the square of a real number can never be negative. If there is an answer to  $\sqrt{-25}$ , it lies outside  $\mathbb{R}$ , the set of real numbers.

Consider the number 8. Since  $2^3 = 8$ , we can say that 2 is a **cube root** of 8. In fact, it’s the only cube root of 8, simply because there’s no other real number whose cube is 8. Perhaps a little surprising is that we can calculate the cube root of a negative number without leaving  $\mathbb{R}$ . For example,  $\sqrt[3]{-27}$  equals  $-3$ , since  $(-3)^3 = -27$ .

The number 16 has two **fourth roots**. The positive fourth root is  $\sqrt[4]{16} = 2$ , and the negative fourth root is  $-\sqrt[4]{16} = -2$ . After all, both 2 and  $-2$  raised to the fourth power result in 16. However, just like square roots,  $\sqrt[4]{-1}$  is not a real number.

The **fifth root** of 32 is 2; that is,  $\sqrt[5]{32} = 2$ . This is because  $2^5 = 32$ . Like cube roots, we can calculate the fifth root of a negative number. For example,  $\sqrt[5]{-243}$  equals  $-3$ , since  $(-3)^5 = -243$ .

### □ SIMPLIFYING MORE ROOTS

Assume that  $x$  and  $y$  represent non-negative numbers. Then

$$\boxed{\sqrt[n]{xy} = \sqrt[n]{x} \sqrt[n]{y}}$$

The root of a product  
is the product of the roots

Another useful rule for radicals is the following. If  $x$  represents a non-negative number, then

$$\boxed{\sqrt[n]{x^n} = x}$$

The  $n$ th root cancels  
the  $n$ th power

[The special case of simplifying  $\sqrt{x^2}$ , where  $x$  is negative, will not be dealt with in the chapter.]

**EXAMPLE 4:** Simplify each radical expression:

A.  $\sqrt{200} = \sqrt{100 \times 2} = \sqrt{100} \times \sqrt{2} = 10\sqrt{2}$

B.  $\sqrt[3]{81} = \sqrt[3]{27 \times 3} = \sqrt[3]{27} \times \sqrt[3]{3} = 3\sqrt[3]{3}$

C.  $\sqrt[4]{1250} = \sqrt[4]{625 \cdot 2} = \sqrt[4]{625} \cdot \sqrt[4]{2} = 5\sqrt[4]{2}$

D.  $\sqrt[3]{2250}$  Sometimes the radicand (the 2250) is too big to easily see if there's a perfect cube in it. So let's try a slightly different approach. We factor the 2250 into primes to get

$$2250 = 2 \cdot 3^2 \cdot 5^3$$

Clearly we can take the cube root of  $5^3$  (it's 5), but there are not enough of the other factors to take their cube roots. So we can write

$$\sqrt[3]{2250} = \sqrt[3]{2 \cdot 3^2 \cdot 5^3} = \sqrt[3]{5^3} \cdot \sqrt[3]{2 \cdot 3^2} = 5\sqrt[3]{18}$$
